CTI TECH TIP

What General Services Can Affect ADAS Systems?

Many of the services we perform on today's cars can have an unintended effect on Advanced Driver Assist Systems (ADAS). Without an awareness of how the vehicles you are working on are equipped and how these systems function, we may be inadvertently reducing the functionality and effectiveness of critical safety systems. Let's walk through a few examples:

You should be concerned about the ADAS while performing wheel alignment. Wheel alignment involves adjusting the angles of the vehicle's wheels to ensure proper tire wear and optimal handling. However, ADAS relies on sensors and cameras that may be affected by changes in wheel alignment, specifically thrust angle. Since forward facing sensing technology like cameras, radar and LiDAR are calibrated to the vehicles body centerline, it's crucial that thrust angle be correct. A deviation of 1 degree will move the sensor's angle of view about 62 inches at 100 yards. The same effect applies to ride height differences and tire sizes. Most manufacturers do not allow calibration to be compensated for lifted or dropped vehicles. In addition, some OEs require calibration after any alignment.

When working on a vehicle equipped with ADAS, it is essential to document any adjustments made during the wheel alignment process and inform the customer about the impact on the ADAS systems. This ensures transparency and enables the customer to be aware of any potential recalibration needs or changes in system behavior. Following proper procedures, consulting vehicle service information, and taking necessary precautions will help ensure the safety and functionality of the ADAS systems after the alignment is performed.

Brake service is another area that requires an awareness of ADAS functionality. Automated Emergency Braking is designed to work properly with known brake friction design and a properly operating hydraulic system. Changing to a non-oem spec pad will result in a change in braking effectiveness and opens the door to diminished AEB effectiveness. The same holds

true of brake fluid is serviced with the incorrect fluid. Many newer cars require DOT4 LV (low viscosity) fluid. Failure to use this fluid where required will slow the operation of valves in the Hydraulic Control Unit and increase the possibility of extended braking distances.

If you are replacing radiators, condensers or any other components that require removal of a bumper cover or bracing around the forward-facing sensor, that sensor technology must be calibrated after reassembling. Don't be tempted to reuse any mounting brackets that appear bent or otherwise damaged. Also, don't forget that a sensor may need to be mechanically leveled before the grill or bumper cover is installed. Refer to service information for details.

When servicing windshields, make sure that the glass is OE or OE equivalent. Poor quality glass can refract the camera image and make the camera inaccurate or not function at all. Also make sure that the camera is mounted correctly in the bracket. Even small differences can cause inaccuracies or even failure of calibrations.

Keep in mind that advanced driver-assisted systems are continuously evolving, with new technologies being introduced regularly. To ensure competent servicing, it's important to stay updated on the latest advancements, maintenance requirements, and manufacturer recommendations. Attend training sessions, seminars, or certification programs to enhance your knowledge and skills related to these systems.

Remember, advanced driver assist systems play a crucial role in vehicle safety, and as an automotive technician, it is essential to carry out maintenance tasks with utmost care and proficiency to ensure the continued functionality and reliability of these systems.
